La stigmatisation élimine la personne du constat

« Cet examen indique que **l'attitude négative** des professionnels de la santé envers leurs patients souffrant de troubles liés à l'usage de substances sont monnaie courante et contribuent à des **soins de santé défectueux** pour ces patients. »

« En recherche expérimentale, on a découvert que le mot **« abuseur » accroît la stigmatisation sociale**, ce qui peut avoir un impact sur la qualité des soins et agit comme **barrière aux traitements** que recherchent les personnes qui souffrent de dépendances. Au lieu de cela, la recommandation de plusieurs est l'usage de termes qui reflètent les troubles (par ex., trouble lié à **l'usage de substances**) et l'usage de langage qui parle de la « personne d'abord. »
